

how to run the file

1, in cmd :

create a venv

python -m pip install --upgrade pip

pip install -r requirements.txt

pip list

2,

Postgres

3,app.py:

```
app = Flask(__name__, template_folder="templates")
app.config["SECRET_KEY"] = os.environ.get("SECRET_KEY", "change-this-development-secret")
app.config["SQLALCHEMY_DATABASE_URI"] = os.environ.get(
    "DATABASE_URL", "postgresql://postgres:"postgrepass"@localhost:5432/carresell_db"
)
```

4,

flask db init

flask db migrate -m "Initial migration"

flask db upgrade

5,flask run

6,after logging in from several accounts to give admin privileges to someone:

```
from app import db, User
```

```
user = User.query.filter_by(email="admin@example.com").first()
```

```
user.is_admin = True
```

```
db.session.commit()
```

```
print(user.is_admin)
```

login and the admin privilege you can export and see different things.

our app now has:

price range

similar car display on the basis of features not price

history and online learning as user updates the price they bought the car

admin dashboard
